Purchase transaction method for e-commerce, involves transmitting card's unique ID code to card service system by seller for verification for debiting price of selected goods from card account.

Patent Assignee: ANDERSON K E (ANDE-I)

Inventor: ANDERSON K E

Number of Countries: 001 Number of Patents: 001

Patent Family:

Patent No	Kind	Date	Applicat No	Kind	Date	Week

US 20020147662	A1		10	G06F-017/60	Provisional application US 2001282382

Abstract (Basic): US 20020147662 A1

NOVELTY - An account associated with a card is activated by providing the card's unique ID code to a card service system. Goods/services offered by a seller is selected through a website, and the ID code is transmitted to the seller. The purchase price of selected goods/services, is debited from the account after the seller verifies the ID code using the card service system.

USE - For e-commerce transactions.

ADVANTAGE - Minimizes risk due to fraudulent usage of card and protects privacy of user while purchasing through Internet, by using the unique ID code for the card.

DESCRIPTION OF DRAWING(S) - The figure shows the flowchart illustrating prepaid card acquisition and activation process.

Patent Details:

Patent No	Kind	Lan	Pg	Main IPC	Filing Notes
US 20020062243	A1		9	G06F-017/60	Provisional application US 2000240194

Abstract (Basic): US 20020062243 A1

NOVELTY - The people's ideas in any marketing sector is tested by online and online services interconnecting networks. The test results are used to market products, goods and services in any marketing sector by building infrastructure and markets around the products goods and services and anything that can be created.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are included for the following:

- (1) Process of building an establishment or city;
- (2) Process method to build a new world brand name;
- (3) Process method of futuristic city or an island or elsewhere;
- (4) Process method to promote in marketing future brands and intellectual property future brands in any and all marketing sectors;
- (5) Method to invent or create and promote for manufacturers to manufacture and market licensed products under the future name;
- (6) Process method is name and not limited to the name future and claiming the process and methods of building markets, interconnecting markets infrastructures and anything online;
- (7) Method creating marketing in retail store sectors, financial sectors, entertainment sectors, research, regular TV broadcasting ,online, health car and any service sector; and
- (8) Method to discover new technology new service.

USE - For creating business and building infrastructure to test ideas online in any market place for building new world brand name for futuristic city, for doing business by testing, producing, marketing, advertising and building infrastructure, for interconnecting infrastructures, for discovering new products and intellectual products, for building establishment or city, for building infrastructures markets on line with web sites, for inventing or creating and promoting manufactures to manufacture and market licensed products, for creating marketing in retail store sectors, financial sectors, entertainment sectors, research sector, regular TV broadcasting sector, online sector, health care sector and any service in any industry.

ADVANTAGE - Creates languages, writing art, taste, touch, feel, and any means of communication. Many names can be attached on to the name future, thus provides more rights and ways to create new product services by creating markets and open structures around those ideas and sectors.

DESCRIPTION OF DRAWING(S) - The figure shows the schematic view of vast infrastructure creating building process.

JP 10505594	W		21	C07B-061/00	Based on patent WO 9607973
-------------	---	--	----	-------------	----------------------------

Abstract (Basic): WO 9607973 A

Prepn. of selected chemical cpds. comprises: (a) generating a database of three-dimensional chemical structures by selecting appropriate organic molecules of known structure, as starting cpds. and combining by one or more well-defined, chemical reactions to form three-dimensional chemical structures; (b) defining search criteria for identifying potentially active cpds and conducting a search for hits; (c) selecting and synthesising one or more chemical structures from the hits of (b); and (d) testing the selected chemical cpds. synthesised in (c) for activity.

USE - The method id used to synthesise potential lead cpds based on a novel strategy of compiling a database including cpds for which known procedures of synthesis are available.

ADVANTAGE - Once a chemical structure has been selected after a search for hits in the database, it is possible to synthesise it without major effort because the reaction required is an established one.

The number of 3D chemical structures may be increased almost indefinitely by including an increasing number of starting organic mols. The database can be custom made to include certain structural elements which are thought to be essential for a certain biological function.

Abstract (Basic): KR 2001055734 A

NOVELTY - A method and a system for paying by electronic money is provided to be used at not only an Internet electronic commercial transaction but a real transaction.

DETAILED DESCRIPTION - A consumer(100) joins to the membership of an electronic money managing company(300) and opens an electronic money account. Also, the consumer(100) may join to the membership of an electronic commercial transaction company(200) and receives bonus score in accordance with a purchase from the company(200). The consumer(100) may convert accumulated bonus score through a transaction with company(200) into an electronic money being managed by a system server(300) of an electronic money managing company. The consumer(100) requests the conversion by connecting to a homepage of the electronic commercial transaction company(200). As the result, the electronic money corresponded to the bonus score is provided to the consumer(100) through a certification process with the electronic money managing company(300).

Abstract (Basic): WO 200049552 A2

NOVELTY - A call center (41) has data entry ports for initiating access and for executing transactions like video conferencing with a bank at representative station (40) via an interface (17). Station (40) and CPU (60) perform operable electrical and data communications with data, voice and image processor, to enable the bank to interact with the customer in real time and to provide customer access to the CPU.

DETAILED DESCRIPTION - The interactive point access financial and information system comprises a remote automated teller machine (ATM) (10), the call center (41), a depository (12). The bank representative station (40) includes a CPU, and data, voice and image processor operably connected to the call center (41), station (40) and CPU. The depository includes a security box which is operable via command functions at the station (40). The call center executes desired transactions like deposits, withdraws, loans, and exchanges information with the banker in real time on face to face basis. INDEPENDENT CLAIMS are also included for the following:

(a) method of providing interactive point access banking information;

(b) remote interactive point access virtual financial and information system

USE - For providing integrated platform of services like video conferencing, commercial depository, and customized automated teller machine used for dispensing event tickets, discount coupons, cash withdrawal, deposits and providing coupons for bank products and services.

ADVANTAGE - The system provides of full service virtual bank to a customer and enables **remote transactional** engagement, on demand basis at high level of availability like seven days a week, 24 hours a day. Enables the customer to access and execute all major transactions on demand basis and further serves as a medium for information from multiple sources. As the system is operated by computer implemented software, it enables the customer to remotely process check accounts, use a **cash card** or check card, charge a check, Use infobank, check order/reorder, execute direct deposit **authorization**, access saving account information and review personal financial profiles. Uses software program logic, which is robust and user friendly, and provides the customer with various options to access and close among various bank services. The call center which is a customer service platform, provides third party services like insurance, travel, investment and

similar services which are of general interest to the customer. The interactive video conferencing enables face to face interview and conversation with a bank representative who assists the remote customer in opening new deposit accounts, direct deposit capability, reorder checks, provides general information regarding loans, forward loan applications, discuss additional product offerings of the bank, and answers customer service related questions. The system is modular and expandable to be compatible with emerging technologies like internet/intranet, cellular systems and high bandwidth digital communications, for enabling individual and institutional customers to access full banking services from remote locations.

DESCRIPTION OF DRAWING(S) - The figure shows the block diagram representing operational interface of the remote interactive point access financial and information system.

NOVELTY - The limitation and restriction on usage of electronic

money account received from an account holder is stored in a memory. A processor processes a transaction on the electronic money account in conjunction with limitation and restriction and outputs an approval and disapproval signal to the account holder.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is also included for account security providing method.

USE - For **electronic transaction** between point-of-sale device and customer to provide financial transaction and/or wireless communication device **authorization**, notification and/or security for any number and/or types of accounts including credit and accounts, charge card accounts, debit card accounts, **currency card** accounts or smart card accounts, electronic money or electronic **cash accounts** and/or other transaction card accounts, financial accounts, brokerage accounts, saving accounts, checking accounts, automated teller machine accounts, wireless or cellular device or telephone accounts.

ADVANTAGE - Provides real time notification of financial transaction.

DESCRIPTION OF DRAWING(S) - The figure shows block diagram of account security providing apparatus.

Abstract (Basic): JP 11203560 A

NOVELTY - Each prepaid card has a coded identification number which is read by a bar-code reader (3) for electron transaction (A). By comparing the identification number in the code of prepaid card, with predefined stored information, settlement of shopping price using prepaid card is approved or disapproved by a secure server (7) connected to internet (6). DETAILED DESCRIPTION - An INDEPENDENT CLAIM is also included for point of sales shopping price setting system.

USE - For setting shopping price using prepaid card for point of sales system in general store.

ADVANTAGE - As the **electronic transaction** is allowed only after **verification** of code in the **prepaid card**, injustice such as

counterfeit of **prepaid card** and reconstruction can be prevented reliably. Burden on the general store is reduced, by setting shopping price using **prepaid card**. DESCRIPTION OF DRAWING(S) - The figure shows a block diagram of shopping price setting system. (3) Bar-code reader; (6) Internet; (7) Server; (A) Electron transaction.

Detailed Description

Detailed Description

... a transaction, it is necessary that the consumer 10 establish a
relationship with the secure **private** agent 16. This can be accomplished
by registration via the internet. The consumer 10 establishes contact
with the World Wide Web site of the secure **private** agent 16 by
initiating the channel 24 and provides the information needed by the
secure **private** agent 16. Alternatively, the registration can be
accomplished by directly accessing the server 36 of the secure **private**
agent 16 via a telephone channel 38. In the event the consumer is
reluctant to use even a secure internet site, it is possible to register
with the secure **private** agent 16 by a completed application form
transmitted by mail or courier, or by using a **prepaid card** that can
be currently be bought in " **virtual** " **shops** .

The registration process using the internet will now be disclosed in
further detail.

- ... bile telephone networks by buying a telephone card at a shop,
on which card a **concealed** code number is present, which can be
uncovered after the purchase of the telephone card...
- ...processing unit via a terminal and the communication
network, after which the central processing unit **verifies** the
payment and instructs the terminal to print a receipt carrying
a specific code number...unit. When the consumer has paid for
recharging the prepaid value, the salesperson inputs his **identification**
code and the amount via the keypad. The amount ap
pears on display 10 and the...
- ...a terminal identifi
cation code. If terminal 1 comprises two or more units, this
terminal **identification code** will preferably comprise a sub
code for each unit. Central processing unit 6 can **verify** the
source of a payment message by means of the terminal **identification**
code, whereby the central processing unit can also ver
ify the subcodes. This provides a safeguard...
- ...decoded, whereby the central processing unit is capable of
identifying, by means of the terminal **identification code**, the

sales outlet at which terminal 1 is present. The central processing unit determines...

...terminal for the central processing unit 6 can be recognized as a telephone, so that **verification** of the telephone number of terminal 1 constitutes a first security measure. Then the processing unit 6 **verifies** the terminal **identification code** and thus, if applicable, also the subcode of the terminal units. The processing unit 6 furthermore **verifies** the combination of the terminal **identification codes** and the telephone number. The processing unit 6 is arranged in such a manner ...that only payment messages from telephone numbers that are known and that contain correct terminal **identification codes** will be accepted. Each terminal assigns a session sequence number to each payment message, which...

...the consumer inserts his smart card, after which terminal 2 sets up a connection with **verification** unit 8 via network 5, Terminal 2 thereby indicates in its communication with the **verification** unit 8 that payment is to take place to the administrator of the central processing...

...The electronic payment further takes place in the usual manner. After the payment has been **authorized**, the verification unit 8 sends terminal 2 an **authorization** message in a usual manner. After receipt of said **authorization** message, terminal 2 composes a payment message which includes the telephone number and the amount with which the prepaid value is to be recharged, and possibly also the **authorization** message. Said payment message is then transmitted to the central processing unit 6 in...the central processing unit 6. Central processing unit 6 sets up a connection with **verification** unit 8 in order to have the payment verified, and after the **authorization** message has been received, the further processing of the payment message from terminal 3 takes...

...Internet, at which web site the consumer can subsequently ask for a recharge of the **prepaid value** in a manner that is usual with **e-commerce**. The further handling of the received payment message by central processing unit 6 takes place...of telephone services. The central processing unit 6 furthermore provides protection against unauthorized use by **verifying** the telephone number of the terminal from which the payment message is being received, by **verifying** the terminal **identification code**, by **verifying** whether the telephone number and the terminal **identification code** correspond and by recording session numbers. The invention is not limited to the embodiments de...

Detailed Description

Detailed Description

... the user tries to purchase goods by an electronic transaction, the host receives the second **unique number** and a second sales amount from a merchant server D in which the electronic transaction takes place, and compares the second **unique number** and the second sales amount with the second issued **unique number** and the balance, respectively. When the second **unique number** is identical to the second issued **unique number** and the balance is not zero, the host authorizes the **electronic transaction** using the **pre - paid card** by a second amount. The second amount is the second sales amount 10 when...the card is to purchase goods or service in an off-line transaction. The second **unique number** 16 is generated by the random number generator of 3 (the card issuer, also, but...

...Thus, unless the user removes the scratch-off material, another person cannot know the second **unique number** 16. The second **unique number** is used to authorize the card when the owner of the card is to purchase goods or service in an **on - line transaction**.

FIG. 4 shows a procedure of issuing the **pre - paid card** shown in FIGS I through 3. First, after a card body is provided in step...issuer's Internet server 70 makes the card holder input the password and the second **unique number**, and transmits the password, the second **unique number**, and the sales amount to the **pre - paid card** host sub-system 50 to seek the approval of the transaction. The other feature of the **authorizing** procedure in the **electronic transaction** is similar to that in the off-line transaction.

On the other hand, the **pre - paid card** according to the present invention may be 'lized when the holder purchases goods or services...

...00). Accordingly, the authorization request message including the ID of the card issuer, the first **unique number**, and the sales amount is transmitted to the VAN host 40 (step 102). Recognizing that...

...50 (step 104). The main computer 52 decodes the received data and checks the first **unique number** and balance stored in the database 54 (step 106).

The main computer 52 compares the...FIGS. I OA and I OB illustrate another example of the procedure of authorizing the **pre - paid card** in the **on - line transaction**. In the example of FIG. 9, the shopping mall 70, 72a, or 72b directly receives the password and the second **unique number** from the client computer 84 and transmits such data to the main computer 52 to...

...main computer 52 so that the main computer 52 receives the password and the second **unique number**.

First, the purchaser may click the "PAYMENT" button to proceed to the W payment stage...

Treatment: Economic aspects (E); General, Review (G)
Abstract: Smart cards offer a wide variety of applications that could revolutionise payment transactions, reduce costs, and spur **online**

purchasing . Despite the benefits these electronic purses offer, a number of issues inhibit their widespread use, especially in open systems. A tested technology, smart cards can store various types of encrypted information as well as **cash balances** and digital signatures. A **secret key** can be used to secure **E - commerce transactions** as well as protect the card contents. These keys are vulnerable to attack, however, and the **stored - value** feature is attractive to international money launderers. How real is the case against smart cards? When compared to the benefits that facilitate adoption, the negative aspects appear to reflect unfounded fears. This paper presents a case for global acceptance of **stored - value** smart cards and explains how this affects the competitive positioning of diverse stakeholders. (26 Refs)

Abstract: The expansion of the Internet has been driven primarily by the **private** sector, and **electronic commerce** is flourishing because the **private** sector has taken the lead in implementing it. Technology has made it possible to pay for goods and services over the Internet. Some methods are linking existing electronic banking and payment systems, including credit and **debit card** networks, with new retail interfaces. By using some of the latest **electronic commerce** techniques, the US General Service Administration (GSA) has been able to streamline one of its key organizational processes. At the same time, the GSA has been able to eliminate the large amounts of paper associated with the purchase and billing process. Others should follow the example of the GSA and explore ways of utilizing **electronic commerce** to provide more effective and efficient services. (0 Refs)

Abstract: These days smart cards are replacing traditional magnetic cards for payment transactions. One of the main reasons is the enhanced security capabilities built into a smart card. Most of the works on smart cards concentrate on single applications such as network access control, prepaid phone card or **debit card**. With popularity of Web technologies, there is a trend towards smart cards being used for different **electronic commerce** applications such as electronic purse for payment transaction over Internet. But the payment protocols proposed so far do not support negotiation, bargaining or **privacy** issues between the parties. Based on the framework of CapBasED-AMS (a Web based secure workflow management system), we developed a prototype system called SmartFlow to demonstrate multi-applications on the Internet using a smart card. The main focus of this paper is to present the framework of SmartFlow and demonstrate a negotiation and bargaining protocol for **electronic commerce** activities in both static and dynamic environment. We have already implemented the prototype system with these functionalities. (19 Refs)

Treatment: Practical (P)

Abstract: Imagine possessing a single card having a small microprocessor chip that contains all the pertinent details identifying you. Not only would this smartcard allow you to carry your identity with you, but it would also store monetary values that could be used for paying any goods and services of your choosing. Health, banking, driving, voting information and stored **money values**, allied with authentication mechanisms that allow you to gain access to your company's offices and internal computer network, all neatly packaged in one little card protected by your very own personal identification number. Those experts in the token and smartcard industry believe that this could very well be what is to become of smartcards in the not-so-distant future. If not to this extent, given their authentication, nonrepudiation, encryption and mobility benefits, smartcards will surpass the security offered by user name and password in logging onto a company network. In addition, card technology may help drive forward the adoption of public key infrastructure (PKI). Experts contend that PKI, the digital certificate system of **private** and public key pairs that are validated by certificate and other registration authorities to verify and authenticate each party involved in an **Internet transaction**, is key to driving e-business. (0 Refs)

Abstract: A variety of cryptographic techniques are being used to minimize threats to **electronic financial transactions**. The explosion of the Internet has permitted even small merchants to sell goods and services to a worldwide market, yet it has also exposed them to the depredations of

a large pool of attackers whose motives range from greed to boredom. Fear of these risks has created a demand for security features built directly into **electronic commerce** systems. The good news is that existing security mechanisms can be combined to minimize a wide range of threats to **electronic commerce**. Security isn't the only problem. European banks will soon have electronic **stored value** cards that are as good as cash. Forgetting the password for a **stored value** card could be as troublesome as losing a wallet. The mechanisms used to solve security problems can be divided into four areas- **privacy**, authentication, integrity, and scalability-though a single mechanism can often mitigate more than one kind of problem. The cornerstone of all **privacy** mechanisms is encryption. An encryption algorithm transforms a plaintext message into an unreadable ciphertext using a key. The correct key can reverse the process, permitting anyone who knows it to get the plaintext message. (0 Refs)

Abstract: The Keyline Smart Card offers a pre-paid electronic payment facility. The cardholder can load funds into the card from his/her bank or building society account (via Keyline). These funds can then be used to purchase a wide range of products and services. This type of payment is essential for certain time-dependent transactions (e.g. home betting). It can make low value transactions feasible (e.g. sale of information). It can also make ordinary purchases more profitable, due to the low commission rate. If that is not enough it contains all the card/account numbers (plus expiry dates) which the cardholder wishes to use via the Keyline system e.g. VISA, Access, Amex, retailers cards, **debit cards** etc. Instead of these account details being quoted insecurely and often inaccurately over the telephone, they are sent automatically from the smart card in a secure electronic message. To replace the signature the retailer can ask the consumer to enter his **secret** password. This is checked within the card. The Keyline card also gives transportability. It can be used in any Keyline compatible terminal-in public terminals, e.g. in hotels, and even at the point of sale. (0 Refs)

BBL to start e-services

THAILAND: BBL TO LAUNCH E-PAYMENT SERVICES

The Nation (XBO) 19 Sep 2000 Online

Language: ENGLISH

In December 2000, Thailand's top **private** bank Bangkok Bank Limited (BBL) will launch e-payment services. BBL has poured B 2 mn into the development of the e-payment gateway, which will initially focus on the business-to-client (B2C) **e - commerce** segment before moving on to the business-to-business (B2B) segment. <Mobile phone service provider> Advanced Info Service's homepage network operator Shinee.com will provide the e-payment service for BBL. BBL also has plans later on to embark on Internet banking, said its executive vice president Krip Rojanastien. Separately, BBL has struck a deal with Internet service provider (ISP) Jasmine Internet. The resulting joint marketing campaign, JiNET BBL Connect, will witness the ISP's subscribers getting a discount if they sign-up for two years and make payment via BBL's credit and **debit cards**. The campaign will run up to end-2000.

Adetel sitio ideal para las pymes

MEXICO: ADETEL TARGETS SMALL COMPANIES

Excelsior (YZZ) 25 May 2000 Online

Language: SPANISH

In Mexico, the first international subsidiary of Adetel International, Adetel Mexico, has launched its services of business solutions geared towards the market niche of the medium- and small-sized companies. The company, which has the technical support of Nortel Networks, is planning to invest nearly US\$ 20mn within the next three years in order to increase its client's base, currently at 10,000, but it expects to reach 40,000 by the end of 2000. The service will basically provide small companies with Internet, e-mail, design, development and implementation of virtual **private** networks as well as business-to-business, business-to-consumer and **e - commerce** applications together with extranet. In addition, Adetel has developed strategic alliances with Avantel and ATT together with Maxcom and Telmex; meanwhile, Adetel has also implemented its penetration strategy

into the residential segment with the use of a **prepaid card** to surf the web, SurfCard.

Esta garantizada la seguridad en operaciones de banca electronica
MEXICO: PATAGON.COM GIVES ON-LINE SECURITY
El Economista (Mexico) (YZS) 25 Apr 2000 Online
Language: SPANISH

With a new on-line debit system, internet portal Patagon.com of Mexico hopes to provide more on-line security for consumers and encourage the usage of the internet for banking and commerce. The new system, incorporating a new encrypting process, will allow consumers to complete **on - line transactions** with a **secret debit account** code instead of a **private** credit card number. The portal company also has plans to extend its services to universities to encourage **electronic commerce**, while also strategizing the introduction of **on - line stock trade** to the general public. Patagon.com serves more than 35,000 clients in Venezuela, Argentina, and Chile, and it is anticipated that over 10,000 users will use the system in Mexico in its first three months.

Demand for Micropayment Systems grows
US: DEMAND FOR MICROPAYMENT SYSTEMS
Wall Street Journal Europe (WSJ) 21 Mar 2000 p.26
Language: ENGLISH

As a result of the increasing amount of digital content available for sale over the **web**, the **market** for micropayment systems is growing rapidly, according to entrepreneur Fredrik Sidfalk. Previous unsuccessful attempts to create micropayment systems have also now started to encourage companies to brave the market. Many of the new systems are based on a multilevel approach, as opposed to a single concept or payment mechanism, which allow customers to make small payments that are charged to electronic invoices, **prepaid accounts**, telephone bills and **private** bank accounts. The **digital content market** is expected to grow substantially over the next

few years, partly due to the boom in digital music content.

Pacific Internet and SingTel going regional
SINGAPORE: PACIFIC/SINGTEL TO EXPAND ABROAD
Business Times (XBA) 20 Jul 1998 P.11
Language: ENGLISH

According to Nicholas Lee, the CEO of Singapore's Internet Service Provider (ISP) Pacific Internet, the firm will enter four countries in Asia in the next two years, including China, by either setting up a new local ISP or acquiring stake in an existing ISP. Pacific Internet will also provide **electronic commerce** and is testing an **electronic commerce** service between Japan and Singapore. A group of small and medium enterprises in Japan will issue consumers with **debit cards**. The consumer can order goods from Pacific Internet's cybermall by using the **debit cards**. This **electronic commerce** service will start in early 1999 and will expand to involve more countries and use additional payment systems like credit cards. SingNet, Singapore Telecom's (SingTel) ISP, will begin a 45 megabits per second satellite link to America by the end of 1998, which will nearly double its traffic capacity to America, according to its CEO Leong Shin Loong. According to SingTel's business communications managing director Victor Kwok, the firm intends to set up a regional network dedicated to corporate clients, which will be separated from the Internet but connected to it. SingTel's regional business network will be more reliable and have better guaranteed quality of service than the Internet. The network will allow firms to build secure **private** networks linking their offices in different countries (called intranets), and international connections to other firms (called extranets), with security against "unauthorised" firms.

public, private firms join electronic money race
JAPAN: ALL GEARED UP FOR THE ELECTRONIC RACE
The Japan Times (XAO) 28 Sep 1996 P.12
Language: ENGLISH

In Japan, the public sector, including the Bank of Japan, Finance, International Trade and Industry, Posts and Telecommunications, Bank and Justice ministries are all geared up for the electronic money race. The

ministries have recognised this field as an opportunity to heat up growth in the telecommunications and other relatively new industries. They have been very active since July in their research in electronic money, hearings on all experiments conducted by banks and other firms in this area have been held. In view of this potential change in the financial landscape, the Justice Ministry has set up a panel to seriously assess the need to revise laws to maintain financial stability. The posts ministry, on the other hand, intends to conduct a three-year experiment program with the **private** sector to test the validity of both electronic money - the ' **stored - value** ' products and 'access' products. Lastly, the **private** sector is also busy carrying out experiments to catch up with its US and European counterparts, in the race to develop international standards for the **electronic commerce** . For instance, Fuji and Daiichi Kangyo are among the **private** banks involved in accelerating Japan's development in the use of electronic banking and money.

NEW YORK--(BUSINESS WIRE)--May 17, 2000--

InternetCash(TM), the Only Alternative for Shopping Online Without a Credit Card, Gains Access to Tens of Thousands of Merchants through

Partnerships with Industry Leaders

InternetCash Corporation (<http://www.internetcash.com>), the only company to offer an alternative to credit cards for online shopping, today announced that it has partnered with the top e-commerce package providers and storefront hosts to offer online merchants a turnkey solution for accepting InternetCash.

The InternetCash Merchant Tool Kit has been developed for the following software packages: IBM NetCommerce 3, Intershop3, Allaire ColdFusion, Microsoft Site Server w/Commerce3, LaGarde Storefront 2000, Smith-Micro Web Catalog 4, Mercantec SoftCart 5. Additionally, InternetCash has partnered with leading e-commerce storefront hosts like Americart and Freemerchant.com as well as payment processors like Plug'nPay, to bring InternetCash functionality to the thousands of hosted storefronts on the web.

"By partnering with Industry leaders, we are rapidly closing in on our goal of making InternetCash a universal online tender

type, right there next to Visa and MasterCard," said Charles Doherty, CEO and co-founder of InternetCash Corporation. "InternetCash is the only way the next wave of online consumers can participate in e-commerce."

How InternetCash Works

InternetCash is a simple, pre-paid stored value card. The cards are available for purchase at brick-and-mortar retailers or online at <http://www.internetcash.com>. By simply logging on to the InternetCash's Web site (<http://www.internetcash.com>), InternetCash cards can be activated and immediately used for online shopping at over 200 online merchant sites including TWEC.COM, ArtistDirect.com, Sunglasshut.com, Overstocked.com and more. InternetCash is private, anonymous and never requires users to provide any personal information. InternetCash eliminates the need to send personal credit card information over the Internet while simultaneously erasing the online merchants charge-back exposure.

About InternetCash Corp.

InternetCash Corp. was founded as a financial technology company in February 1999. The company's focus is on developing "best of breed" e-commerce consumer products, and payment and transaction infrastructure solutions for the Internet. InternetCash, the company's flagship product, is the only alternative to credit cards available for shopping online today. Headquartered in New York City, the privately owned company has received funding of over \$12 million to date. Investors include Silicon Valley venture capital firm El Dorado Ventures, as well as private investors D. James Bidzos, co-founder and chairman of the board of VeriSign and Daniel Lynch, co-founder and former chairman of the board of CyberCash. InternetCash.com's board of advisors includes Professor Ronald Rivest, Ph.D., co-founder of RSA Data Security. For additional information, visit the company on the Web at <http://www.internetcash.com>.

Note to Editors: InternetCash is a trademark of InternetCash Corporation. All other products and company names referred to herein may be trademarks or registered trademarks of their respective companies or mark.

iPIN adopts nCipher's nShield for database encryption to help

ensure customer privacy

WOBURN, Mass., Sept. 18 /PRNewswire/ -- nCipher(TM) plc., (LSE: NCH), a leading developer of Internet security products for e-commerce and Public Key Infrastructure (PKI) applications, today announced that iPIN, the leading provider of e-Payment technology, has selected nCipher to further manage security risks at all levels of the e-Payment value chain, including secure communications over the Internet and the encryption of critical, private information stored in secure databases. iPIN provides financial institutions, telecomm service providers, automotive OEMs, ISPs, and e-commerce merchants with modular payment software that gives customers a wide range of payment options and transaction choices over any Internet-enabled device.

As new e-commerce services are rolled out, the ability to protect critical information -- such as credit card numbers, personal and corporate data and passwords -- is a driving force in the success of e-Payment consumer adoption. While the use of encryption has been limited to the protection of information that is in transit, for example over the Internet, iPIN and nCipher are taking it one step further to protect the data through encryption, while the user is actually online and conducting transactions, and also at the database where information is stored for future use.

In choosing nCipher's nShield, a tamper-resistant, FIPS 140-1 level 3 certified HSM (hardware security module), iPIN is one of the first e-Payment companies to implement this more comprehensive approach, securing the content of its informational databases and archives through the use of advanced encryption techniques and dedicated security hardware. This approach protects the cryptographic keys used to put the information out of reach to potential attackers.

"Due to increased e-commerce security threats, it is our duty as the leading e-Payment provider to ensure that our

customers have the highest level of confidence that their personal information is safe," said Chris Hagmann, director of Systems Engineering and IT Operations, iPIN. "At iPIN we believe that security technology such as nCipher's can enable new services that would otherwise be too risky. The ability to secure our core information at the database level with nShield, accelerate and secure each transaction with nForce, and easily manage the entire security process to fit every possible customer scenario and need, allows us to scale our services and build loyal customer relationships."

To protect information in transit to and from users connected with computer based browsers or wireless devices, iPIN chose nCipher's nForce e-commerce accelerator. nForce provides enhanced security and high-powered SSL (Secure Sockets Layer) acceleration to overcome the security risks and excessive delays that are often associated with the use of the SSL protocol on unprotected server platforms.

"Protecting information in transit is vital to preventing transactions from being overheard but increasingly users are demanding that their information is in safe hands long after the transaction is complete," said Stu Vaeth, director of product marketing, nCipher. "We are pleased to be working closely with iPIN as they enable a wide variety of industries to offer e-commerce and mobile payment services that meet the needs of users everywhere. By addressing security issues as they emerge, iPIN is able to bring familiar payment techniques such as pre-paid cards and cash to online transactions, making the wireless environment a natural place to do business."

About iPIN

iPIN (www.ipin.com) is the leading provider of global e-payment technologies to financial institutions, telecommunication providers, automotive OEMs and merchants. iPIN enables its partners to offer modular payment products to support B2C, B2B and person-to-person applications in both the wireless and Web environments. iPIN enables users to easily and securely pay for Web and wireless purchases using existing financial relationships, such as bank accounts, credit cards, debit cards, ISP and wireless bills, pre-paid accounts, and cash. Customers include British Telecom, Hong Kong and Shanghai Banking Corporation Limited, France Telecom, Club Internet, and Internet Gold among others. For further information, contact in the U.S., Rhonda Motil, +1 650-272-3770, (rmotil@ipin.com), and in Europe, Marc Kawam +33 1 58 56 72 03, (marc@ipin.com), or visit the website www.ipin.com.

About nCipher

nCipher is a leading developer of Internet security products specifically designed for e-commerce and Public Key Infrastructure (PKI) applications. nCipher's products, which incorporate both hardware and software, help its customers to solve problems of information security, systems scalability and processing speed in e-commerce and PKI applications. In addition, nCipher also offers technical support and professional services. nCipher's products are particularly well suited to e-business users with high volumes of security-sensitive transactions, such as banking and financial institutions, e-retailers and service providers (ISP/ASPs) and Government agencies

nCipher is listed on the London Stock Exchange as a TechMARK 100 company (LSE: NCH). With offices in Cambridge, UK; Boston, New York and San Francisco, USA; Dublin, Ireland; Paris, France; and Hamburg, Germany, nCipher serves customers and partners around the world. For more information on nCipher visit our website at www.ncipher.com.

REVISION DATE: 00000000

Peppercoin's Peppercoin 2.0 allows merchants to earn profits from small credit and **debit card** purchases. The system's Universal Aggregation (TM) technology combines individual consumer payments across multiple merchants. It supports a wide range of credit and **debit cards**. Peppercoin 2.0's distributed processing features streamline **authorization** and other payment operations. The system includes digital **certificate** and other security features. It provides users with payment gateway and customer self-service components. Peppercoin integrates with **e - commerce** systems. It does not require the creation of separate consumer accounts.

Abstract (Document Summary)

Online shopping services that offer an alternative to shoppers without credit cards are discussed. The service providers include ECharge, Cybermoola and InternetCash.

Full Text (999 words)

Copyright *PC World Communications, Inc.* Feb 2001

FIRST

SURE, SOME people feel Visa is everywhere they want to be, and others won't leave home without their American Express card, but more than onethird of the U.S. population don't own credit cards. That lack of plastic has kept those millions of people out of the online shopping frenzy.

Enter ECharge, Cybermoola, InternetCash, and other companies, each of them aiming to provide you with an alternative to credit cards to use for your online shopping. The concept has been around since 1994, but only now are these services making serious inroads, popping up on major e-commerce sites such as Barnesandnoble. com and Buy.com.

Merchants benefit as well. They not only increase their potential buying audience, but they also gain the ability to offer inexpensive items (\$10 and under) that are not profitable when handled via credit card transactions. Many e-cash vendors charge merchants lower fees than credit card companies do and have a simpler sign-up process.

CASH IN MANY COLORS

ALTERNATIVE payment options vary depending on how users fund their purchases (see chart, page 62). Today, a stored-value model is most common: You fund an online account with traditional currency-either cash or credit card. Services like Cybermoola and InternetCash fall into this group. Services such as ECharge Phone adhere to a different model-here, you accumulate a balance, then pay a single bill each month.

Limited acceptance plagues all alternative payment methods. And finding out which stores take your option can be a chore. Most store sites list the forms of payment they accept, but such listings can be deceptive. To use an alternative payment service, you may have to enter a merchant site from the e-cash vendor's "mall" or Web portal, and some merchants don't list certain e-cash options on their information page, even though they do accept these at the virtual checkout. To be safe, check your e-cash vendor's site for a list of online shops that accept that payment method.

PIN MONEY

CYBERMOOLA Sounds completely Web-based, but this stored-value option requires an offline component. You buy

Cybermoola credits at your local supermarket or via snail mail in \$20 to \$100 chunks, just as you would with a prepaid phone card. You then log on to the company's Web site and enter those credits into your account. As long as your account has funds, to shop, just enter a PIN number at the checkout stage on Cybermoola's site.

If you lose your Cybermoola receipt before uploading the credit into your account, you can't get a refund. Cybermoola also takes some effort to buy: Today only four chains-Big Bear, P&C, Quality Market and ShopRite-sell it; the company is negotiating with others.

InternetCash, another prepaid option, works much like Cybermoola but is available nationwide through Western Union, bill-payment merchant In Person Payments, and prepaid service provider Pay Smart America. You can also buy it at the company's Web site, using a credit card or Western Union PayCash (another ecash service). To spend your riches, go directly to any of more than 200 stores online.

InternetCash plans to test a better option in the first quarter of 2001. The program will let participants use their own bank-supplied debit card and PIN number at over 80,000 Net stores. Buyers never have to convert cash or credit into e-cash. A Gartner Group report predicts that online purchases via debit cards will account for up to 30 percent of all online shopping by 2003.

Achex is already in place and works like a debit account. You give Achex your banking information and create a user name and password. At sites that accept Achex (three at press time, many more on the way), you choose Checks as a payment option, then enter your user name and password. Your purchase is deducted from your checking account.

ECharge Phone service is a different beast. The account is linked to your phone bill, and your online charges appear just the way long-distance calls do. That setup makes ECharge Phone easy to use and to abuse: Users can get in over their head without set credit limits. ECharge also offers a new Net Account option that lets you link to your credit card or prepay; this option is currently accepted at six sites.

Some e-cash vendors opt for a hybrid. Trivnet, a technology infrastructure provider, lets ISPs, mobile operators, and other third parties provide customers with Trivnet's WiSP currency. Users prepay or get charges on their monthly bills.

WHAT'S IN IT FOR ME?

ASIDE FROM helping reduce your dependency on credit cards-and the interest charges these entail-most ecash methods restore your anonymity. Sure, Net merchants still know your name and address, but they can't tie you to the leather jacket or plane tickets you bought last week-and that cuts down on targeted ads and profiling.

E-cash also increases security. Many people feel safer not giving out credit card information online, says ECharge chair Ron Erickson. E-cash account numbers sent to and from stores aren't tied to social security numbers or addresses. If hackers intercept this data, they get only the account number and bill amount. Unlike with credit cards, most e-cash options require you to supply a password to complete a transaction. Stolen possession of an account number by itself is unlikely to permit fraudulent charges.

Discover has responded to security concerns with its Discover Deskshop 2 service. When you shop, Discover generates a random number for you to use in place of your credit card number at a given site. You never give the online vendor your real card number, and you don't have to worry about acceptance-if the site takes the Discover card, you can use this service.

"Consumers are looking for a payment option that combines a recognizable brand with ease of use," says Jupiter Research analyst James Van Dyke. "In the end, a bank or existing payment option that offers a wide variety of payment options under one roof is probably the model that's going to succeed."

Abstract (Document Summary)

Online shopping services that offer an alternative to shoppers without credit cards are discussed. The service providers include ECharge, Cybermoola and InternetCash.

Full Text (999 words)

Copyright *PC World Communications, Inc. Feb 2001*

FIRST

SURE, SOME people feel Visa is everywhere they want to be, and others won't leave home without their American Express card, but more than onethird of the U.S. population don't own credit cards. That lack of plastic has kept those millions of people out of the online shopping frenzy.

Enter ECharge, Cybermoola, InternetCash, and other companies, each of them aiming to provide you with an alternative to credit cards to use for your online shopping. The concept has been around since 1994, but only now are these services making serious inroads, popping up on major e-commerce sites such as Barnesandnoble. com and Buy.com.

Merchants benefit as well. They not only increase their potential buying audience, but they also gain the ability to offer inexpensive items (\$10 and under) that are not profitable when handled via credit card transactions. Many e-cash vendors charge merchants lower fees than credit card companies do and have a simpler sign-up process.

CASH IN MANY COLORS

ALTERNATIVE payment options vary depending on how users fund their purchases (see chart, page 62). Today, a stored-value model is most common: You fund an online account with traditional currency-either cash or credit card. Services like Cybermoola and InternetCash fall into this group. Services such as ECharge Phone adhere to a different model-here, you accumulate a balance, then pay a single bill each month.

Limited acceptance plagues all alternative payment methods. And finding out which stores take your option can be a chore. Most store sites list the forms of payment they accept, but such listings can be deceptive. To use an alternative payment service, you may have to enter a merchant site from the e-cash vendor's "mall" or Web portal, and some merchants don't list certain e-cash options on their information page, even though they do accept these at the virtual checkout. To be safe, check your e-cash vendor's site for a list of online shops that accept that payment method.

PIN MONEY

CYBERMOOLA Sounds completely Web-based, but this stored-value option requires an offline component. You buy

Cybermoola credits at your local supermarket or via snail mail in \$20 to \$100 chunks, just as you would with a prepaid phone card. You then log on to the company's Web site and enter those credits into your account. As long as your account has funds, to shop, just enter a PIN number at the checkout stage on Cybermoola's site.

If you lose your Cybermoola receipt before uploading the credit into your account, you can't get a refund. Cybermoola also takes some effort to buy: Today only four chains-Big Bear, P&C, Quality Market and ShopRite-sell it; the company is negotiating with others.

InternetCash, another prepaid option, works much like Cybermoola but is available nationwide through Western Union, bill-payment merchant In Person Payments, and prepaid service provider Pay Smart America. You can also buy it at the company's Web site, using a credit card or Western Union PayCash (another ecash service). To spend your riches, go directly to any of more than 200 stores online.

InternetCash plans to test a better option in the first quarter of 2001. The program will let participants use their own bank-supplied debit card and PIN number at over 80,000 Net stores. Buyers never have to convert cash or credit into e-cash. A Gartner Group report predicts that online purchases via debit cards will account for up to 30 percent of all online shopping by 2003.

Achex is already in place and works like a debit account. You give Achex your banking information and create a user name and password. At sites that accept Achex (three at press time, many more on the way), you choose Checks as a payment option, then enter your user name and password. Your purchase is deducted from your checking account.

ECharge Phone service is a different beast. The account is linked to your phone bill, and your online charges appear just the way long-distance calls do. That setup makes ECharge Phone easy to use and to abuse: Users can get in over their head without set credit limits. ECharge also offers a new Net Account option that lets you link to your credit card or prepay; this option is currently accepted at six sites.

Some e-cash vendors opt for a hybrid. Trivnet, a technology infrastructure provider, lets ISPs, mobile operators, and other third parties provide customers with Trivnet's WiSP currency. Users prepay or get charges on their monthly bills.

WHAT'S IN IT FOR ME?

ASIDE FROM helping reduce your dependency on credit cards-and the interest charges these entail-most ecash methods restore your anonymity. Sure, Net merchants still know your name and address, but they can't tie you to the leather jacket or plane tickets you bought last week-and that cuts down on targeted ads and profiling.

E-cash also increases security. Many people feel safer not giving out credit card information online, says ECharge chair Ron Erickson. E-cash account numbers sent to and from stores aren't tied to social security numbers or addresses. If hackers intercept this data, they get only the account number and bill amount. Unlike with credit cards, most e-cash options require you to supply a password to complete a transaction. Stolen possession of an account number by itself is unlikely to permit fraudulent charges.

Discover has responded to security concerns with its Discover Deskshop 2 service. When you shop, Discover generates a random number for you to use in place of your credit card number at a given site. You never give the online vendor your real card number, and you don't have to worry about acceptance-if the site takes the Discover card, you can use this service.

"Consumers are looking for a payment option that combines a recognizable brand with ease of use," says Jupiter Research analyst James Van Dyke. ... 1997.

This slow progress has been due partly to concerns about privacy and security on **Internet transactions**, partly to the systems aspects of these technologies that require a great deal of coordination...

...costs of using the U.S. telephone system have allowed merchants quickly and cheaply to **verify** credit card and debit card validity, thus encouraging their use and limiting the advantages of **stored - value** and smart cards. (By contrast, in Europe, where telephone charges are substantially higher, merchants are more receptive to **stored - value** and smart cards, in which the value transfer occurs offline and does not require a costly telephone call for **verification**.)

The next decade will surely see new applications of electronic technologies and more widespread use...

Abstract (Document Summary)

Several card companies have introduced prepaid-card products specifically for teenagers -- Visa's Buxx cards and American Express Co.'s Cobaltcard are two examples. But the newest generation of prepaid cards seems to be aimed at a wider market. A role model is the prepaid telephone card, which has become omnipresent and is particularly popular among people who lack long distance telephone service. (Industry purists differentiate prepaid cards from so-called stored-value cards. With the former, funds reside at the bank; with the latter, they reside on the card.)

Indeed, the prepaid cards issued by KeyCorp and PrivaCash, a private company in Toledo, Ohio, are specifically modeled after telephone cards. PrivaCash MasterCard customers can keep their identities away from Internet merchants, and the company emphasizes that the card is not linked to any bank account or personal financial information.

Distribution is a problem for PrivaCash. PrivaCash sells the cards in \$25, \$50, and \$100 denominations, for prices of \$4.95, \$5.95, and \$7.95, respectively. The cards are packaged with discount coupons from various merchants, which are meant to offset the card's price.

(Copyright American Banker Inc. - Bond Buyer 2001)

Aiming to create a mass market for a growing category of plastic, several banking and nonbanking companies have recently introduced prepaid payment card products under the Visa and MasterCard brands that function as cash and can be used to buy goods in stores or on the Internet.

The banking companies -- including the pointpathbank.com subsidiary of Synovus Financial Corp. and a partnership of KeyCorp and PrivaCash Inc. -- are marketing them, respectively, as merchant-neutral gift cards and as a way to preserve the privacy of the person doing the spending.

The prepaid cards emulate the brand-specific gift cards offered at many retail stores. For the past year or two mass merchandisers such as Target Corp., Barnes and Noble, and Federated Department Stores have been promoting attractively packaged gift cards that customers can buy for a modest fee, usually around \$5, and recipients can spend in the designated stores.

The evolution of the cards follows the same path taken by general-purpose bank cards, which were spawned by retailers' private-label cards.

From the consumer's perspective, the prepaid cards have several disadvantages. Users must pay a fee for them. And they can't reload them, nor can the cardholder convert them to cash at an automated teller machine.

So far, the cards are hard to come by. Pointpath's is only available through the Internet. PrivaCash's is available at Andersons, an Ohio superstore chain; a few other retailers; and in some community bank branches (though not KeyCorp's). People who buy them can partially activate the cards at the point of sale, but must complete activation either on the company's Web site or through a toll-free number.

Another drawback: Using them on the Internet usually requires typing in elaborate PINs. And though some companies will track the balances on their cards and replace lost or stolen cards (for a fee), in most cases losing a prepaid card is like losing cash.

The biggest obstacle to acceptance may be that "they require that you go out and conduct a transaction in advance of an actual purchase," said Ken Kerr, a senior analyst in Durham, N.C., for GartnerGroup Inc. "Where can you spend it? How much do you want to plunk down on a card that you might only be able to use on five Internet sites that you don't have any interest in?"

On the plus side, the issuers of these cards, which generally record minimal information about their owners, say their products appeal to people who fear their privacy will be breached or their credit card account data stolen if they buy goods on the Internet.

The issuers also say the prepaid cards, which work everywhere Visa and MasterCard are accepted, are especially good for potential Internet-shoppers who do not have credit cards or who worry about the fees and interest charges associated with credit cards.

Several card companies have introduced prepaid-card products specifically for teenagers -- Visa's Buxx cards and American Express Co.'s Cobaltcard are two examples. But the newest generation of prepaid cards seems to be aimed at a wider market. A role model is the prepaid telephone card, which has become omnipresent and is particularly popular among people who lack long distance telephone service. (Industry purists differentiate prepaid cards from so-called stored-value cards. With the former, funds reside at the bank; with the latter, they reside on the card.)

Indeed, the prepaid cards issued by KeyCorp and PrivaCash, a private company in Toledo, Ohio, are specifically modeled after telephone cards. PrivaCash MasterCard customers can keep their identities away from Internet merchants, and the company emphasizes that the card is not linked to any bank account or personal financial information.

"It's as close to cash as you can get because it's not connected to any person's private information," said David Sutton, executive vice president at PrivaCash.

Doug Blasiman, president of PrivaCash, said the cards are "very different" from teen cards, which require "parents to have an account set up specifically for their child in their name and linked to the parents' account."

However, distribution is a problem for PrivaCash. PrivaCash sells the cards in \$25, \$50, and \$100 denominations, for prices of \$4.95, \$5.95, and \$7.95, respectively. The cards are packaged with discount coupons from various merchants, which are meant to offset the card's price.

Unlike cash, PrivaCash cards expire after six to nine months. If the funds are not used up within that time, a cardholder can contact the company and get a refund -- which comes with a service charge.

The Visa gift card introduced recently by pointpathbank, an Internet-only bank, works in much the same way, only it is being marketed specifically as a present, and people can send personalized greeting cards with it. People who want to get the card can register at the pointpath.com Web site, and the bank will send e-mails to their friends suggesting that they buy one as a gift.

Pointpath's "gift card reminder calendar" lets people type in dates of special occasions, and the company will send e-mail reminders of the event.

"We allow our gift card clients at pointpath to receive real-time inquiries of their balances and previous transactions online," said David Mize, director of Web development at pointpath.

Ecount of Conshohocken, Pa., is pitching its MasterCard-branded cards to companies -- which would distribute them as incentives or rewards -- rather than consumers. Ecount's partner in this venture is Bank One Corp.

Other companies are introducing similar products without the Visa or MasterCard imprimatur. InternetCash Corp. of New

York has three prepaid card products that let people buy goods online anonymously. Though the cards can be bought in any of 6,000 stores, they can only be used on the Internet.

Unlike PrivaCash, InternetCash does not charge a fee above the card's face value. The company instead charges the merchant a percentage of the transaction.

"Our network was built from the start for the Internet, whereas Visa, MasterCard, and Amex were built for brick and mortar," said Benjamin I. Reddy, executive vice president and cofounder of InternetCash.

When an InternetCash cardholder goes to the checkout page of a Web site and clicks on the InternetCash logo, a window pops up, and the consumer enters a card number and a personal identification number. InternetCash verifies the information and sends the merchant a digital signature guaranteeing payment. "The merchant never sees the consumer's card number," Mr. Reddy said.

This market niche has already had a casualty, Cybermoola of San Francisco, which went out of business in December after its venture capital dried up. Eric Freeman, the former president and CEO of Cybermoola, said its card was on sale in about 250 supermarkets but could only be used at about 50 online sites. Each transaction generated revenue but not enough to offset the company's fixed costs, he said.

Paul Jamieson, senior analyst for banking and payment services at Gomez Advisors, an e-commerce consulting firm in Waltham, Mass., said: "The Internet has been littered with a number of firms that tried to create a proprietary payment system and failed because they were unable to create a critical mass of merchants or consumer use. You need one of the two. If you don't have either, it's difficult to get the ball rolling."

ONLINE RETAILERS BEGIN TO EVALUATE ALTERNATIVES TO CREDIT CARDS

Enlarge 200%
Enlarge 400%

HOLIDAY SEASON 2000 IS OVER AND THE RESULTS ARE IN: PEOPLE ARE shopping online in droves. While the numbers weren't as high as retailers wanted, Kmart's BlueLight.com, for example, posted a 1,060-percent year-over-year increase in sales. It's safe to say that the e-commerce players have not only led horses to the trough but have also made them take a deep, sustained drink

A whopping 95 percent of online shoppers use credit cards to complete their transactions, according to Jupiter Research. But the Internet's dependence on plastic leaves an entire population out of the equation, since more than 40 percent of Americans don't own or can't qualify for an American Express, Visa, or Discover card. To tap into this market, smart online retailers are adding alternate payment options, such as Flooz and eCharge, to the forms of payment they accept.

"You've got teens out there who don't have a way to shop online, and people with poor credit or who choose not to use credit cards. Eventually, you have to cater to these groups," says Robert Sterling, an analyst with Jupiter Research.

In many cases that's easier said than done. Despite the large number of banks, startups, and financial services providers who have announced products since 1994, when the first alternate payment option-CyberCash-was announced, customers have been slow to adopt these services. In addition, since many of these products are based on proprietary technology, online retailers have been cautious about using them. Bank on the wrong standard and you can be left holding the check at the end of the e-commerce feast.

There are several types of offerings available, including stored credit and accumulating-balance currencies. Stored credit methods require consumers to fill an online card or account with offline money in the form of cash or a credit card. Accumulating-balance options tie a new online account to an existing account. For example, consumers who use eCharge's Net Account can add purchases to their utility bills.

Not surprisingly, each of the more than 15 payment options comes with its own set of technical requirements. This stands in stark contrast to the credit card industry's standard method of adding credit card acceptance to a Web site. For online retailers, adding a merchant account is relatively simple. For low-end sites, the process usually begins with the creation of a merchant account, and the securing of a Secure Sockets Layer (SSL) certificate through a third-party certificate broker. Alternatively, purchases can be called into the retailer's bank or manually put through a credit card machine, but this method is often more expensive; banks charge more for manual credit processing. Customer service can also be a problem, since visitors don't get automatic approval for their purchases.

Most midsize or large sites contract with third-party credit card processing companies such as CyberSource, IntelliPay, VeriSign, or SurePay, which process transactions and retrieve approvals using SSL technology. Usually, little needs to be changed on the merchant's Web site aside from adding a link to the provider's commerce engine and adding the appropriate credit card graphics. Again, this is in stark contrast to the alternate payment arena, where nearly all of the options available require specific changes to a site's commerce engine in addition to adding graphics and links to the site.

Some alternate payment providers are doing the legwork and investment for retailers. ECharge not only provides the necessary hardware and software to retailers but also the integration. In addition, says Ron Erikson, eCharge's chairman, the company does not require a setup or signup fee, which are often required by credit card companies [see sidebar].

Credit card companies have been charging retailers a processing fee on purchases for years, but merchants are generally reluctant to pay provider's fees to alternate-payment companies in the face of research showing that consumers won't pay a fee to use an alternate payment method. This problem looms largest for providers of person-to-person options such as PayPal and Bank One's eMoneyMail as they get ready to move into the business-to-consumer market. Today, PayPal makes its services available to consumers at no cost. Consumers and small businesses can send and receive payment via their bank accounts and credit cards without paying a fee. The service has caught on quickly, especially on auction sites, but who is going to pay once retailers are involved?

Some service providers are banking on the idea that even though there are some fees that they will have to recoup, as a whole they offer retailers a less expensive option than traditional credit card providers, which charge transaction fees of up to three percent. Praxell's prepaid service, for example, charges either a \$0.20 per-transaction fee or 1.5 percent of the transaction value, whichever is greater.

Yet some alternate-payment providers claim they provide a better service than their credit card-based counterparts, even with accompanying fees. Flooz, for example, which is sold as a gift-giving option, directs customers to its site, handles the initial transaction, and sends Flooz recipients to its partner sites. "Shoppers who arrive at our site and go through to our merchant partners have conversion rates of five to ten times that of other ecommerce sites. We're providing customer acquisitions. We send retailers transactions," says Robert Levitan, the co-founder, chairman, and CEO of Flooz.

Retailers and payment providers face a classic chicken-and-egg dilemma: Unless numerous retailers offer these services as an option, consumers have no reason to use them. But in the absence of an existing consumer base, there's little incentive for retailers to add payment options to their shopping carts. This situation is changing, albeit slowly. RocketCash, which caters to the teen set, is accepted by more than 120 sites. InternetCash, a prepaid card that's sold at brick-and-mortar retail stores, has signed more than 160 online merchants, and DoughNET, an online banking account that's prefunded with cash, is up and running on 70 sites.

Despite the technological challenges, some online merchants are adding alternate payment methods to their site for reasons that have little to do with the need to reach consumers who don't own credit cards. One of the most significant is that alternate payment methods are perceived to have security advantages over credit cards. When a retailer accepts a credit card online, as far as the credit card provider is concerned, it's a "card not present" transaction. In the offline world, "card not present" is afforded the same liability parameters as other credit card payments: The merchant isn't liable for fraudulent charges. Online purchases are another story. If an online credit card purchase goes bad, the merchant, not the credit card provider, eats the cost. Last year, online retailers reported a fraud rate of 3 percent, which is roughly 30 percent

higher than its offline counterpart, according to Celent Communications, a financial services consulting firm. Since alternate payment options offer a more controlled transaction that is often approved by the same companies that provide the service, many payment providers offer merchants a 100-percent fraud guarantee: If anything goes wrong, the payment provider is liable.

For prepaid options such as Praxell Inc.'s Praxicard and Cybermoola's eponymous card, security is less of an issue, because the cards are not tied to credit card or checking accounts. Consumers are required to buy them offline, and acceptance comes directly from the service.

"Cybermoola can't be used outside of the Cybermoola world, so your account won't end up on a list of credit card numbers," says Eric Freeman, the company's CEO. "Someone can only spend what resides in his or her Cybermoola account, which is only accessible with a user name and PIN. They're never exposing their whole credit lines."

Another reason many payment options cite is promotion: Retailers who partner with alternate-payment providers get free marketing from the sites, which often send consumers their way, as Flooz does, for example.

Service providers say it will take some time before retailers and consumers understand them and feel comfortable using them. "Online merchants need a guaranteed transaction," says Ben Reddy, executive vice president of business development for InternetCash. "It's going to take a little while before they understand that they won't have to worry."

ECharge in Charge

AH, THE SWEET SMELL OF success. PerfumeShop.com president and CEO Farhad Abolfathi says he caught a whiff when a consultant introduced him to an alternative payment system from eCharge.

The consulting firm CCI Industries helped Abolfathi design the site and has hosted and managed it since 1998. Last spring, CCI introduced Perfume Shop to eCharge and helped integrate the alternate payment option into the site's offerings. The partnership has expanded the upscale e-tailer's customer base and provided a sales boost in the form of an eCharge entry point to the site.

Nader Kheyrdan, president of CCI Industries, originally developed Perfume Shop on Windows NT, using Microsoft's Site Server Commerce Edition, Internet Information Server (IIS), and SQL Server. Using Site Server's credit card processing capabilities, the company was able to be up and selling its products from the day it launched. Adding eCharge's Net Account was more complicated. It required adding an additional server, a Compaq ProLiant with a proprietary PCMCIA card to handle encryption, that passes off authorization requests to eCharge's database.

Perfume Shop was able to add the new server without dipping into its own coffers, says Merrie Gomi, Perfume Shop's vice president of marketing and sales. ECharge provided the servers and helped with integration.

After installing the new server, Kheyrdan also had to add some code to the site's front end and added Logos and Links back to the eCharge transaction server. ECharge sales are processed differently than credit card sales: The new eCharge server intercepts the user's payment request and tells the site's main commerce engine not to use its existing DLLs as the payment gateway. When eCharge receives authorization from its main server, the transaction information is passed back to the site's commerce engine where it is merged with eCharge's fulfillment and accounting databases. Using a combination of Java and Active Server Pages, Kheyrdan had eCharge up on the site in six months. Implementation took longer because it was a pilot program with bugs to work out, Kheyrdan says. Today, the same process would take considerably less time—one day to several weeks at the most, he says.

Perfume Shop's Gomi was pleased with the experience. "When Nader brought eCharge to us as an option, we said yes immediately. With credit cards, the biggest threat is fraud. With eCharge, the transaction is guaranteed and off our plate," says Gomi. "We also felt that we could serve our customers by giving them another payment option."

Since eCharge Net Account was added, sales are on the upswing, says Gomi. Perfume Shop is so impressed with the success of its alternative payment system that the company is planning a copromotion later in the year, says Gomi. The results have been more than satisfactory. "We didn't anticipate sales like this. We were pleasantly surprised."

Smells like a winner. -K.J.B.

7-Eleven Inc. and American Express Co. have introduced a prepaid card for online shopping.

The "7-Eleven Internet Shopping Card" is being sold at U.S. 7- Eleven stores. The card can be loaded with a value of between \$25 and \$1,000, and can be reloaded. There is a 4% fee to load the card.

People can buy the cards with cash or credit cards. They can be used at online merchants that take American Express, or at 7-Eleven retail stores. 7-Eleven and American Express already collaborate on financial services in 7-Eleven convenience stores. Amex has 5,000 automated teller machines in 7-Eleven stores, and plans to install more.

How it works: A company creates a virtual currency that will be accepted only on the Internet. Retailers download the software that accepts the currency, and customers download software that offers the currency. The customer generally buys Internet currency using real money, often provided through a credit card, and the retailer receives real money in exchange for the Internet currency.

Who is doing it: PayPal, a unit of X.com Corp., is by far the best-known person-to-person payment system online, with three million registered users. It processes about 100,000 transactions a day, with an average payment of \$50. You'll need a password to collect your payment.

How it works: Prior to conducting the transaction, both parties agree to register with the same escrow service and agree to its terms. The buyer then transmits payment via credit card, check or bank transfer to the escrow service. Once the escrow service verifies the payment, the seller sends the merchandise to the buyer for inspection. If the items are acceptable to the buyer, the escrow service transmits payment to the seller.

Full Text (2132 words)*Copyright Dow Jones & Company Inc Oct 23, 2000*

Ever since business came to the Internet, people have been trying to figure out new and better ways to buy and sell goods online. Yet despite all the effort, the old ways seem to be working pretty well, with an estimated 95% of Internet purchases completed with a credit card.

Yet there are problems with using a credit card online. One is security. Although most credit-card transactions are safe, there are instances of credit-card number theft, such as a virtual break-in that occurred at eUniverse Inc.'s CDUniverse.com.

Another concern is privacy. Some people would rather not give their credit-card information to an unknown Web retailer, especially in light of Toysmart.com Inc.'s decision to offer to sell its database of credit-card customers as part of a bankruptcy-court proceeding.

So, as electronic commerce grows into a \$38 billion (44 billion euros) business in 2000, lots of people are trying to find new ways to make money off of it. "Everyone is trying to get a piece of these electronic transactions," says Paul Hagen, a senior analyst at Forrester Research Inc., a Cambridge, Massachusetts, market-research firm.

Here is a summary of the current state of affairs in the world of e-money. The list isn't comprehensive. Start-ups seem to emerge every day.

Digital Cash

What it is: A way to store money for use on the Web that is the virtual equivalent of a phone card or a gift certificate.

How it works: A company creates a virtual currency that will be accepted only on the Internet. Retailers download the software that accepts the currency, and customers download software that offers the currency. The customer generally buys Internet currency using real money, often provided through a credit card, and the retailer receives real money in exchange for the Internet currency.

Who is doing it: Flooz.com is probably the best-known provider, thanks in part to its advertisements featuring Whoopi Goldberg. It also has managed to sign up an impressive roster of online retailers that will accept Flooz, including Barnes & Noble.com Inc., Toys "R" Us Inc. and closely held MTS Inc.'s Tower Records. Competitor GiftCertificates.com offers a similar lineup of stores that accept its currency.

New York start-up InternetCash Corp. offers virtual cash cards in amounts of \$10, \$20, \$50 and \$100 apiece. They can be spent at a smattering of Web stores including BuyMP3.com and the Web site of Sunglass Hut International Inc.

Pros: This type of currency is good for gifts, and for people who don't have credit cards but want to make purchases on the Web. They can buy Internet cash or gift certificates and then use them for online shopping.

It also limits fraud. Even if the currency is stolen, it can be used only for a fixed amount of purchases.

Cons: The big hurdle for digital cash is a chicken-and-egg problem. Retailers don't want to install new software unless they see a lot of customers using it. Customers don't want to download software unless they see a lot of retailers accepting it.

This conundrum is what killed DigiCash Inc., a pioneer in this area, which entered bankruptcy proceedings in 1998. "It was hard to get enough merchants to accept it so that you could get enough consumers to use it, or vice versa," founder David Chaum told Forbes magazine.

Virtual Points

What it is: The online equivalent of frequent-flier miles.

How it works: Users earn virtual currency for viewing ads or filling out marketing surveys. They can spend the currency at retailers that have agreed to accept it.

Who is doing it: Beenz.com offers probably the best-known example of this type of currency, with its community of about 2.7 million users, and has signed up 150 stores including CDNow Inc., Venator Group Inc.'s Foot Locker, Blockbuster Inc., Musicland Stores Corp.'s Sam Goody unit, and HMV.com, an arm of HMV Media Group PLC of the U.K. For a cost of 100 beenz, customers can download their beenz onto a MasterCard that can be used in offline stores. One beenz is worth half a cent.

E-Centives Inc. of Bethesda, Maryland, offers e-centives.com, another site that subscribes to the idea of doling out virtual rewards for doing virtual work. Its roster of participating retailers isn't as extensive, though. At MyPoints.com Inc., customers can also "cash out" their points and receive a credit to their checking or credit-card account.

Pros: Like frequent-flier miles, virtual points help retailers lock in customers to their products. The value for customers is that they can get "free money" if they are willing to part with some personal information.

Cons: Same problem as digital cash. Signing up retailers to accept the currency can be a killer obstacle.

Person-to-Person Payment

What it is: A way to send money through the Web to an individual who isn't set up to accept credit-card payments.

This fast-growing area of Web payments owes its success almost entirely to eBay Inc. Now that we're all buying junk from each others' attics, the need for a payment system that doesn't require credit-card-authorization capability has arisen.

How it works: Person-to-person payment systems act like escrow accounts, but without some of the protections offered by escrow, a legal term for an agreement that is put in the care of a third party and won't get executed till certain conditions are met. The sender of money sets up an account with a credit-card number attached. The recipient must "pick up" his or her money by visiting the Web site and giving information of where to send the money -- either a physical address or a bank account.

Who is doing it: PayPal, a unit of X.com Corp., is by far the best-known person-to-person payment system online, with three million registered users. It processes about 100,000 transactions a day, with an average payment of \$50. You'll need a password to collect your payment.

PayPal has a bunch of competitors, though. The largest is Billpoint, which is backed by eBay and Wells Fargo & Co. Others include Yahoo! Inc.'s Paydirect, C/Base Inc.'s Ecount.com, PayMyBills.com's payMe.com and Bank One Corp.'s eMoneyMail.com.

Pros: Billpoint claims it will "empower the entrepreneur in all of us." Indeed, the point of person-to-person systems is to help the average Joe become a mini-retailer without paying money to set up a credit-card acceptance system.

Most person-to-person systems charge no fees to users, because they make their money on the interest earned on the accounts. Some charge fees to small businesses that want to accept payments.

Cons: There's a reason that it is difficult to make credit-card payments to individuals -- namely, such payments can be risky. An unscrupulous person can collect payments but then fail to deliver the goods. Most person-to-person systems don't promise to pay back jilted buyers.

However, this situation is slowly changing. PayPal recently said it will take responsibility for transactions in which the seller agrees to disclose his or her bank-account number. Billpoint guarantees transactions when the buyer uses an electronic check, which essentially is a transfer of money from an electronic bank account.

Virtual Escrow

What it is: A third party ensures that the buyer receives the item and that the seller receives payment.

How it works: Prior to conducting the transaction, both parties agree to register with the same escrow service and agree to its terms. The buyer then transmits payment via credit card, check or bank transfer to the escrow service. Once the escrow service verifies the payment, the seller sends the merchandise to the buyer for inspection. If the items are acceptable to the buyer, the escrow service transmits payment to the seller.

Who is doing it: The market leader is i-Escrow Inc., of San Mateo, California, whose services are used on eBay and Amazon.com Inc.'s auction sites. It claims to have 500,000 users.

Escrow.com, which was founded by Fidelity National Title Insurance Co., an arm of Fidelity National Financial Inc. of Irvine, California, is also a big player, providing the escrow services for cars sold on eBay. However, Escrow.com specializes mostly in business-to-business transactions.

Finally, Tradesafe.com of Providence, Rhode Island, offers escrow services on AuctionWatch.com, a Web site that allows users to bid on auctions on all over the Web. Tradesafe says it has 200,000 users.

Pros: For large purchases, escrow services are a good way for buyers and sellers to protect themselves against fraud. Most guarantee to refund the transaction to buyers who receive faulty merchandise.

Escrow services also don't require a long-term commitment. Both parties need only sign up for a one-time usage of the service.

Cons: Most escrow services charge a fee per transaction, but prices have been coming down in the past year. Even so, some people might not want to pay for the service. The fees are as follows:

At i-Escrow.com, credit-card transactions under \$100 cost \$2.50; those over \$100 cost 4% of the dollar amount of the sale including shipping costs. At Escrow.com, credit-card transactions under \$5,000 cost 3.85% of the total dollar amount of the sale, excluding shipping costs. At Tradesafe.com, credit-card transactions cost 50 cents plus 3.5% of the dollar amount of the sale, including shipping costs.

Digital Wallets

What it is: A way to speed checkout and avoid setting up separate accounts at different Web merchants.

How it works: Users download software that stores their credit-card numbers and personal information. Participating sites download software that enables them to receive payment from the wallet. The process is very similar to digital cash, except that the retailer actually receives a credit-card number rather than a form of Internet currency. The wallet also stores more information than just credit-card numbers; it stores shipping and billing addresses as well.

Who is doing it: Yahoo! Inc. is the leader in electronic wallets, with a roster of more than 11,000 merchants, including Gap Inc., the Macy's unit of Federated Department Stores Inc., Barnes & Noble, Toys "R" Us and Intimate Brands Inc.'s Victoria's Secret. However, its wallet holds only one credit-card number.

America Online Inc.'s wallet, called Quick Checkout, stores 10 credit-card numbers and 15 shipping addresses but is accepted at only 30 merchants, including Blockbuster, Office Depot Inc., Barnes & Noble and Circuit City Stores Inc.

Microsoft Corp.'s wallet, called Passport, claims to be able to store as many credit-card numbers and billing addresses as customers would like to enter. Passport also stores user names and passwords for most Microsoft sites, such as Slate and MSN Auctions. An additional 48 Web merchants have agreed to accept Passport, including Costco Wholesale Corp.'s Costco Online, Office Max and buy.com.

Pros: Wallets can make transactions speedier and solve the problem of having to remember a different password and user name for each Web store. America Online also guarantees transactions conducted with its wallet, an added safety feature for online shopping.

Cons: This approach has the same flaw as digital cash -- the difficulty of signing up retailers. The wallet is also tied to your digital address, so if you're sitting at a different computer than usual, it may not work.

Virtual Credit Card

What it is: A way to use a credit card online without having to disclose the actual credit-card number.

How it works: A bank asks its credit-card customers to download some software onto their computers. Whenever they shop, that software generates a one-time credit card number for the purchase. The merchant doesn't know it's not the real credit card number because when the merchant checks with the bank, the bank confirms that it is tied to the customer's account.

Who is doing it: American Express Co. says it will launch a service this month called Private Payments that lets credit-card customers generate a one-time number for online payments.

Israeli startup Cyota Corp. and Irish firm Orbiscom are racing to sell similar services to other credit card issuers. So far, Cyota's service is available on Isracard, which is owned by Bank Hapoalim of Israel. Orbiscom's service is available through Allied Irish Banks PLC and HFC Bank in the United Kingdom.

Pros: If you're trying to stay anonymous online, this could help. Because of the credit-card scrambling, retailers will know your name and address but not your credit-card number.

Also, both systems let you set a limit on the size and frequency of purchases charged to the credit-card number so that retailers cannot double-charge the credit card.

And most important, it avoids the obstacle that has tripped up so many other electronic payment systems -- the need to persuade retailers to install special software.

Cons: These services are very new and untested, so it's not yet clear what the challenges will be. One possible obstacle is the finite number of credit-card numbers that can be generated and the difficulty of recycling disposable numbers. y

Prepaid card: Also called "stored value cards," these plastic cards function much like a traveler's check; the user pays money up front, gets a plastic card authorizing a certain amount of money, and then spends the value over time. Prepaid cards derive purchasing power from information stored in the card itself. In contrast, ATM and credit cards get their purchasing power from the computer system at the issuing financial institution.
